DAIRY DELIGHT

- We have created an app for dairy services. We have added data of 100 customers into it.
- We created two sql scripts parallely on MySQL workbench
- We have entered 100 orders placed by these 100 customers along with their invoices .
- We have created various categories and added many products to these categories.
- We also added data of various outlets available along with their owners
- Added data of various delivery persons along with their assigned customer_id and outlet which they have to visit.
- We added primary keys to all strong entities of our DB.
- After entering data , we added foreign key constraints to link various entities of our DB.
- We also added indexes to various entries of our table for faster data access
